## *Memory Clinic*

The memory clinic exists to assess, treat and support patients who are experiencing some degree of memory loss and are looking for answers. The clinic also supports patients' caregivers.

The goal of this clinic is early detection so that care and treatment options can be provided for improved client care and caregiver support. We want to help clients with memory difficulties maintain independent living and the best quality of life.

A visit to the memory clinic includes standardized memory testing and in-depth assessment by a team of caring professionals, including doctors, specially trained nurses, an occupational therapist, a social worker and a representative of the local Alzheimer Society. Working together this team will strive to diagnose the cause of your memory impairment, and develop a plan of care to meet your individual needs. Driving may be addressed. Caregivers will also be considered in the treatment plan.

If you or a loved one are experiencing memory impairment that seems more than just normal aging, we can help!

*Ask your family doctor or nurse practitioner if our Memory Clinic may be right for you...*
